

M. Dijkstra

STAFF ENGINEER · ARCHITECT

Amsterdam, Netherlands / Remote or hybrid (CET, with US overlap)
mdijkstra.dev / hello@mdijkstra.dev / github.com/mdijkstra-oss

PROFILE

Software engineer and architect who owns the shape of a system, not just one corner of it. Twenty-five years building software, the last decade in healthtech. Joined PeerWell as its first full-time engineer, designed and built most of a digital therapeutics platform, then stayed through multiple funding rounds and the 2022 acquisition to lead its integration into Bardavon and its relaunch as a new product. Comfortable across mobile, web, backend, infrastructure and applied ML, and equally comfortable being the person who documents the architecture and hands it over.

EXPERIENCE

Bardavon Health Innovations

2022 – 2025 · Remote

Lead Engineer, Acquisition Integration

Led the technical integration of PeerWell into Bardavon after the acquisition.

- Migrated the platform onto Bardavon's infrastructure (AWS Fargate, Docker, GitHub Actions, Terraform) and integrated it with their visual workflow automation platform.
- Rebuilt the product around a different population, from surgical patients to injured workers, and launched it in April 2024 as Recovery+, connecting people recovering from workplace injuries with licensed clinical coaches.
- Reconciled two sets of engineering practices and two sets of assumptions about the codebase across the merged teams.
- Documented the architecture and worked alongside Bardavon's engineers until they fully owned it. Handover completed in 2025.

PeerWell

2016 – 2022 · San Francisco / Remote

First Engineer → Engineering Lead

First full-time engineer on a digital therapeutics platform for surgical preparation and recovery, used by patients directly and built into clinician care pathways.

- Designed and built most of the initial platform: the recommendation engine, configurable scoring, and the patient data model behind them. React, Node/TypeScript, DocumentDB, Swift, HIPAA-compliant infrastructure.
- Built machine learning work in the product, primarily image and pose recognition behind the AI-assisted movement features, including a system for authoring new exercises from sample videos.
- Took on system design as the team grew across the US and Europe, mentored engineers joining the platform, ran interviews, and helped set the hiring bar for a team that was remote almost from the start.
- Co-inventor, published U.S. patent application US20180286509A1: an adaptive recommendation engine combining patient context, historical outcomes and configurable scoring to personalise recovery pathways.
- Outcomes in published work: 26% shorter hospital stays and an 80% relative increase in home discharge (peer-reviewed feasibility study, n=476, *Annals of Translational Medicine* 2019;7(4)); 35% average pain reduction over a 10-week program, ODI-measured (Bardavon company-published case study).

Freelance

2007 – 2016 · Netherlands

Independent Software Engineer

Close to nine years of client work alongside study and later full-time employment. Usually the only engineer, working with designers and whatever the client had in house.

- Owned the full loop: scoping what the client actually needed, agreeing the deliverable, building, deploying, and taking the call when something broke.
- Range from WordPress and marketing sites for local businesses through to an online restaurant ordering and payments platform with orders printing directly at the counter.

SELECTED WORK

Nabu

2025 – present · Open source, solo

An AI-native Integrated Research Environment. Local-first agentic research platform combining LLM-powered qualitative coding, RAG with HyDE, structured data extraction, multi-model consensus voting, SQL querying and document versioning. Prose documents are the source of truth, with incrementally maintained projections into DuckDB-WASM for querying and into memoized selectors for UI state. Go, React, DuckDB-WASM.

SKILLS

LANGUAGES	Go, TypeScript/JavaScript, Swift, Python, SQL
FRONTEND	React, TypeScript, native iOS (Swift), Storybook, incrementally maintained projections, i18n, accessibility, offline and local-first
BACKEND	Node, REST APIs, microservices, SQL and NoSQL
INFRA	AWS, Fargate, Docker, Terraform, GitHub Actions, CI/CD, observability
AI / ML	LLM pipelines and agentic systems, RAG, multi-model consensus and evaluation, computer vision and pose estimation
PRACTICE	System design, architecture documentation and handover, test strategy and CI quality gates, HIPAA-regulated environments
LEADERSHIP	Mentoring and technical leadership, hiring and interviewing, cross-team integration after acquisition
LANGUAGES	Dutch, English

EDUCATION

Hanze University of Applied Sciences · BSc Computer Science · 2011 – 2016

ROC · Computer and Network Systems, CCNA · 2005 – 2009
